

IA#1 — `cartTotal` with a harness · rubric

CSC13008 · individual assignment · 5% of the course · 100 points

Hand in your repository link, the brief you gave your assistant, this week's `AI-LOG.md`, and `SELF_ASSESSMENT_REPORT.md`. The specification is on the session 2 slides and in the starter repository: <https://github.com/fithcmus/wad-cart-starter>.

What is scored

#	Criterion	Points
1	<code>cartTotal</code> behaves as specified	30
2	Tests	20
3	The harness	20
4	The brief	15
5	<code>AI-LOG.md</code>	15

1. Behaviour — 30 points

Marked by running your code against the specification, not by reading it.

Points	What it looks like
26–30	Every rule holds: the worked example returns <code>467400</code> as a number , free shipping at the threshold, empty cart returns <code>0</code> , a negative price or a non-integer quantity throws <code>RangeError</code> .
18–25	The happy path and the threshold are right; one edge case is wrong or missing.
8–17	The happy path is right; two or more edge cases are wrong. <code>toFixed</code> returning a string lands here.

Points	What it looks like
0–7	The worked example does not produce the right total.

2. Tests — 20 points

Points	What it looks like
17–20	<code>npm test</code> passes and covers the worked example, the empty cart, the free-shipping threshold, and both <code>RangeError</code> cases. Each test can fail for one reason.
11–16	Tests pass and cover the happy path plus one or two edge cases.
4–10	One test, or tests that assert the implementation rather than the specification.
0–3	No tests, or <code>npm test</code> fails.

3. The harness — 20 points

Points	What it looks like
17–20	A rules file that a stranger could follow — stack, commands, and at least one "never" — plus a working gate (<code>npm test</code> and one of format/lint) and CI running on push.
11–16	Rules file and a working gate; no CI, or CI that does not run.
4–10	A rules file copied from the slides with nothing project-specific in it.
0–3	No rules file.

4. The brief — 15 points

Points	What it looks like
13–15	Names the files it may touch, the contract, the error cases, and "no dependencies". A stranger could give this brief and get your result.
8–12	Describes the task and the contract; scope or constraints left open.
3–7	One sentence: "write cartTotal".
0–2	No brief submitted.

5. AI-LOG.md — 15 points

Points	What it looks like
13–15	Says which tool, what it produced, what you changed and rejected, and what you wrote by hand. Specific enough to check against the diff.
8–12	Honest but thin — tool and task only.
3–7	One line, or clearly written after the fact.
0–2	Missing, or contradicted by the commit history.

How to submit

One zip file, named after your student ID **and the total you give yourself**:

- individual work — `<StudentID>_<total>.zip`, for example `23120001_82.zip`
- group work — `<StudentID1>-<StudentID2>-<StudentID3>_<total>.zip`, IDs in ascending order, for example `23120001-23120042-23120117_75.zip`

The zip must contain **SELF_ASSESSMENT_REPORT.md**: one row per criterion in this rubric, the marks you claim, and evidence pointing at a file, a section, a commit or a test name — plus a

short *what I did not manage*. The total in that table is the number in the file name. Template on Classroom.

A wrong file name costs no marks but delays your result — the grading script matches submissions to the class list by that name.

Honesty adjustment

Your self-assessment is compared with the mark you actually earn. The gap is **your total - the mark**, on the same 100-point scale.

Gap	Adjustment
within ± 10	none — this is normal calibration
+11 to +20	-3
+21 to +30	-6
more than +30	-10
-21 or worse	-3 — read the rubric before you score yourself down
no SELF_ASSESSMENT_REPORT.md	-10, and the file-name total is ignored

A criterion you claim with no evidence line counts as claimed-and-not-done for this comparison. The adjustment never takes a submission below 0.

Scoring yourself honestly low costs you nothing inside ± 10 . Claiming marks you did not earn costs more than the marks would have been worth.

Notes

- Declaring heavy assistant use costs nothing here. Section 5 rewards the *account*, not a low percentage.
- "It works on my machine" is what CI is for. A green local run with a red CI scores as a red CI.
- You will be asked to explain any line of this in class. That applies to lines an assistant wrote.
